Abstract - Research on the development of silvicultural techniques aiming to implement effective...

Due to parallel exist of two systems on classification of forest status after exploitation; unifyingation method of forest solutions was difficult. The subject developed a classification method of forest status after exploitation on line of unifying those two systems (classification based on standing volume and German's method). At the same time, the subject proposes additionally some silvicultural techniques to improve forest's yield and quality after exploitation:
- Maintaining forest after exploitation.
- Enrichment planting in plot.
- Natural regeneration combined with indigenous trees planting additionally.
