DDT compounds present in Cambodian fish

Traces of DDT have been found in fish from Cambodia’s Great Lake Tonlé Sap, although average levels from other Asian countries. In Monirith and colleagues sampled fish from Cambodia’s coastal waters and Tonlé Sap Great Lake. Traces of DDT were found. In all samples, although concentrations were far higher in Tonlé Sap samples, leading the researchers to suggest that this is because of the widespread use of DDTs in the lake’s basin.
